

Q & A

Electrical Supply

Q: Your current electrical supply is 240V/3Ph/60Hz, which is lower voltage than our standard 480V/3Ph/60Hz. We can make this work on a 40-SG, but it will be more expensive than a typical unit because several components need to increase in size to suit the higher amperage.

A: The electrical system will have to remain at 240V/3Ph/60Hz but please provide cost difference between a unit that needs component increases and one that does not.

Natural Gas Supply

Q: You didn't say what you currently have. We need a minimum of 5 psig and a max of 6.5 psig

A: The regulators at the gas meter are currently set to 6 psig

Plumbing

Q: Can you send a photo of the side of the tank that has the plumbing connections?

A:
